1 Purpose of the Document

This document records all requirement changes, updates, and feedback received from the client during the development lifecycle of the Real-Time Air-Traffic Simulation System. The objective is to maintain traceability of requirement evolution across multiple iterations and to document the rationale behind each change.

2 Change Management Approach

The project follows an iterative development approach. Client feedback is reviewed at the end of each iteration, and necessary updates are documented before being incorporated into the system or requirement specification.

3 Iteration-wise Requirement Updates

Iteration	Client Feedback	Change Implemented	Remarks
Iteration 1	Requested real-time aircraft visualization limited to Indian airspace.	Restricted simulation scope to India-only region.	Change due to API usage limitations.
Iteration 2	Preferred minimalistic UI over detailed visualization.	Adopted minimal UI with simple vector map view.	Improved usability and performance.
